Inserting transparent background .png files for PowerPoint

PowerPoint presentations with custom colored backgrounds benefit from artwork saved and imported as transparent .png files. If you want to know more, please call Multimedia Services at 567-2250.

1. PNG files work in place of traditional JPG files to eliminate rectangular borders around your imported graphics, because the PNG files have an alpha transparency layer.

2. Artwork created in Adobe Illustrator or Photoshop can be exported as a PNG

3. This file type is ideal for animation effects within your presentation, as you can import separate but close fitting elements and manipulate them to move and interact with each other on the same slide.

4. This is particularly suitable for cellular and membrane presentations where there are multi step interactions between extracellular, membrane receptors, and intracellular components.
